

ZETA

The ZETA cabin is designed for use on FUNITEL and 3S systems. It is available in various sizes with a choice of layouts for between 20 and 40 standing or seated passengers.

The new model is suitable for urban applications, for summer and winter tourism, and for public transport in all climate zones.

With its wide central doors, the ZETA is ideal for wheelchair users and also for transporting goods.

General

The ZETA offers grade access and plenty of space with all-round panoramic views. The cabin can be equipped for a wide variety of applications.

Customized versions are available, including a glass floor panel. The ZETA has an easy-to-clean non-slip checker-plate floor with forced ventilation and drainage channels. The ergonomically shaped seating is covered with vandal-proof carpeting. The central seating unit has folding seats (with locking mechanism) to provide additional space according to operating requirements.

Engineering

The ZETA is a 98% lightweight alloy design, with load-bearing components made of special fine-grained steel. This combination of materials has proved highly successful over the years. The cabin is CE-compliant and suitable for use on all brands of ropeways. The tinted polycarbonate windows are mounted in rubber safety gaskets. Thanks to its aerodynamic shape, the ZETA offers excellent performance in wind. The automatic door actuator is state of the art and complies with the relevant codes and standards. It is integrated in the gondola roof and accessible from inside and outside of the cabin. The doors have remote cable operation with an actuation lever fitted to the hanger.
